

Yellow Squiggles Are People

*What one ESLint warning taught me about who I was
excluding*

Last week, this happened.

```
1  function ClickyDiv() {  
2    return (  
3      <div onClick={() => alert('clicked')}>  
4        Click me  
5      </div>  
6    )  
7  }  
8  
9  export default ClickyDiv
```

Who got locked out

Keyboard users

Motor impairments, RSI, broken mouse. Can't Tab to a `<div>`.

Screen reader users

Blind, low-vision. A `<div>` isn't announced as interactive.

Switch & eye-tracking users

Severe motor impairments. All work through the keyboard layer.

The fix

three-piece manual fix

```
function ClickyDivFixed() {  
  const handleClick = () => alert('clicked')  
  
  return (  
    <div  
      role="button"  
      tabIndex={0}  
      onClick={handleClick}  
      onKeyDown={(e) =>  
        (e.key === 'Enter' || e.key === ' ') && handleClick()  
      }  
    >  
      Click me  
    </div>  
  )  
}  
  
export default ClickyDivFixed
```

OR

just use <button>

```
function JustAButton() {  
  const handleClick = () => alert('clicked')  
  
  return <button onClick={handleClick}>Click me</button>  
}  
  
export default JustAButton
```

Use native HTML first. Reach for <div> last.

**Yellow squiggles aren't nitpicks.
They're people.**

Your future user. Your future self. Better software.
